`pointers.c`: A lab exercise for pointers, arrays, and memory

Lesson 1: What are pointers?

Lesson 2: Dereferencing pointers with *

Lesson 3: The integer datatype uses four bytes

Lesson 4: Printing each byte of an integer

Lesson 5: Pointers are just variables that live in memory

Lesson 6: Arrays are just places in memory

Lesson 7: Passing-by-value

Lesson 8: Passing-by-reference

Lesson 9: Passing an array leads to passing-by-reference

`dotProduct.c`: A program to calculate the dot product of two vectors

Programming assignment

Programming assignment

- ▶ Due in 14 days: 11:59pm Thursday, February 11.
- ▶ Use Piazza to ask and respond to questions.
- ▶ By end of today, you will have everything you need for at least part 1, goldbach, part 2, maximum, and part 3, matMul

Chat box

- ▶ Great for everyone to participate.
- ▶ Something that would be useful even outside of the online classroom.
- ▶ Be respectful.
- ▶ Help me monitor for any questions that are going unanswered.

Recap of Tuesday: Stuff we missed.

- ▶ header files
- ▶ `int fscanf(FILE *stream, const char *format, ...)`

`pointers.c`: A lab exercise for pointers, arrays, and memory

- Lesson 1: What are pointers?

- Lesson 2: Dereferencing pointers with *

- Lesson 3: The integer datatype uses four bytes

- Lesson 4: Printing each byte of an integer

- Lesson 5: Pointers are just variables that live in memory

- Lesson 6: Arrays are just places in memory

- Lesson 7: Passing-by-value

- Lesson 8: Passing-by-reference

- Lesson 9: Passing an array leads to passing-by-reference

`dotProduct.c`: A program to calculate the dot product of two vectors

git pull

From the folder 2021_0s_211, type: `git pull`

Lesson 1: What are pointers?

- ▶ Pointers are numbers
- ▶ The unary operator `&` gives the “address of a variable”.
- ▶ how big is a pointer? 32-bit or 64-bit machine?
- ▶ Pointers are typed

Lesson 2: Dereferencing pointers with *

*pointer: dereferencing operator: variable in that address

```
int* ptr and int *ptr
```

No difference between `int* ptr` and `int *ptr`

- ▶ `int* ptr` emphasizes that `ptr` is `int*` type
- ▶ `int *ptr` emphasizes that when you dereference `ptr`, you get a variable of type `int`

Lesson 3: The integer datatype uses four bytes

- ▶ Memory is an array of addressable bytes
- ▶ Variables are simply names for contiguous sequences of bytes

Lesson 4: Printing each byte of an integer

- ▶ Most significant byte (MSB) first → big endian
- ▶ Least significant byte (LSB) first → little endian

Which one is true for the ilab machine?

Lesson 5: Pointers are just variables that live in memory

- ▶ Pointers to pointer

Lesson 6: Arrays are just places in memory

- ▶ name of array points to first element
- ▶ `malloc()` and `free()`
- ▶ stack and heap
- ▶ using pointers instead of arrays
- ▶ pointer arithmetic
- ▶ `char* argv[]` and `char** argv` are the same thing

Lesson 7: Passing-by-value

- ▶ C functions are entirely pass-by-value

Lesson 8: Passing-by-reference

- ▶ You can create the illusion of pass-by-reference by passing pointers

Lesson 9: Passing an array leads to passing-by-reference
