Comparisons and program control flow

- What is control flow?

- Condition codes

- Comparison and set instructions

Modifying control flow via conditional branch statements

- Jump instructions

- Conditional branch statements

Modifying data flow via conditional move statements

- Conditional move statements

Looking ahead

Class plan

1. PA2 grades released last night. Contact TAs Prince and Azita for questions and concerns.
2. Code review session for PA2 ongoing this week. TAs will take attendance to assign participation points.
3. Provide mid-semester course feedback at:
<http://sirs.ctaar.rutgers.edu/blue>
4. Today, Tuesday, 3/9: Assembly control flow and loops.
5. Thursday, 3/11: Assembly loops and function calls.
6. Reading assignment for next two weeks: CS:APP Chapter 3.
7. Programming Assignment 3 on bits, bytes, integers, floats out. Due Monday March 22.

Programming Assignment 3: binToFloat

General reminders

- ▶ PA3 is structured in terms of difficulty similarly to PA1 and PA2.
- ▶ The assignment rewards you for starting early.
- ▶ Use Piazza; We rely on it to gauge what needs further explanation.
- ▶ Later parts (parts 4 and 5) are more open-ended.

binToFloat

- ▶ How to read in the characters.
- ▶ How to accumulate the representation in the binary number.
- ▶ You are not allowed to use pointer casting to directly convert binary representation to float.
- ▶ You may find the %e or %E printf format specifiers useful at some point in PA3. <https://www.cplusplus.com/reference/cstdio/printf/>
- ▶ How to shift and mask for the sign bit.

What is control flow?

Control flow is:

- ▶ Change in the sequential execution of instructions.
- ▶ Change in the steady incrementation of the program counter / instruction pointer (%rip register).

Control primitives in assembly build up to enable C and Java control statements:

- ▶ if-else statements
- ▶ do-while loops
- ▶ while loops
- ▶ for loops
- ▶ switch statements

Assembly/Machine Code View

Programmer-Visible State

- **PC: Program counter**
 - Address of next instruction
 - Called "RIP" (x86-64)
- **Register file**
 - Heavily used program data
- **Condition codes**
 - Store status information about most recent arithmetic or logical operation
 - Used for conditional branching
- **Memory**
 - Byte addressable array
 - Code and user data
 - Stack to support procedures

Condition codes

Automatically set by most arithmetic instructions.

Applicable types	Condition code	Name	Use
Signed and unsigned	ZF	Zero flag	The most recent operation yielded zero.
Unsigned types	CF	Carry flag	The most recent operation generated a carry out of the most significant bit. Used to detect overflow for unsigned operations
Signed types	SF	Sign flag	The most recent operation yielded a negative value.
Signed types	OF	Overflow flag	The most recent operation yielded a two's complement positive or negative overflow.

Table: Condition codes important for control flow

Comparison instructions

```
cmpq source1, source2
```

Performs $\text{source2} - \text{source1}$, and sets the condition codes without setting any destination register.

Test for equality

```
1 short equal_sl (  
2     long x,  
3     long y  
4 ) {  
5     return x==y;  
6 }
```

C code function above translates to the assembly on the right.

```
equal_sl:  
    xorl %eax, %eax  
    cmpq %rsi, %rdi  
    sete %al  
    ret
```

Explanation

- ▶ `xorl %eax, %eax`: Zeros the 32-bit register `%eax`.
- ▶ `cmpq %rsi, %rdi`: Calculates $\%rdi - \%rsi$ ($x - y$), sets condition codes without updating any destination register.
- ▶ `sete %al`: Sets the 8-bit `%al` subset of `%eax` if op yielded zero.

Test if unsigned x is below unsigned y

```
1 short below_ul (  
2     unsigned long x, x = 127  
3     unsigned long y y = 128  
4 ) {  
5     return x < y; x - y = 127 - 128 = -1 = overflow  
6 } CF = 1  
returns 1
```

```
1 short nae_ul (  
2     unsigned long x,  
3     unsigned long y  
4 ) {  
5     return !(x >= y);  
6 }
```

Both C code functions above translate to the assembly on the right.

```
below_ul:  
nae_ul:  
    xorl %eax, %eax  
    cmpq %rsi, %rdi  
    setb %al  
    ret
```

Explanation

- ▶ `xorl %eax, %eax`: Zeros `%eax`.
- ▶ `cmpq %rsi, %rdi`: Calculates `%rdi - %rsi` ($x - y$), sets condition codes without updating any destination register.
- ▶ `setb %al`: Sets `%al` if CF flag set indicating unsigned overflow.

Side review: De Morgan's laws

▶ $\neg A \wedge \neg B \iff \neg(A \vee B)$

▶ $(\sim A) \& (\sim B) \iff \sim (A|B)$

Set instructions

`cmp source1, source2` performs `source2 - source1`, sets condition codes.

Applicable types	Set instruction	Logical condition	Intuitive condition
Signed and unsigned	<code>sete / setz</code>	ZF	Equal / zero
Signed and unsigned	<code>setne / setnz</code>	\sim ZF	Not equal / not zero
Unsigned	<code>setb / setnae</code>	CF	Below
Unsigned	<code>setbe / setna</code>	CF ZF	Below or equal
Unsigned	<code>seta / setnbe</code>	\sim CF & \sim ZF	Above
Unsigned	<code>setnb / setae</code>	\sim CF	Above or equal
Signed	<code>sets</code>	SF	Negative
Signed	<code>setns</code>	\sim SF	Nonnegative
Signed	<code>setl / setnge</code>	SF ^ OF	Less than
Signed	<code>setle / setng</code>	(SF ^ OF) ZF	Less than or equal
Signed	<code>setg / setnle</code>	\sim (SF ^ OF) & \sim ZF	Greater than
Signed	<code>setge / setnl</code>	\sim (SF ^ OF)	Greater than or equal

Table: Set instructions

Modifying control flow via conditional branch statements

- Jump instructions

- Conditional branch statements

Modifying data flow via conditional move statements

- Conditional move statements

Jumping

■ jX Instructions

- Jump to different part of code depending on condition codes

jX	Condition	Description
jmp	1	Unconditional
je	ZF	Equal / Zero
jne	\sim ZF	Not Equal / Not Zero
js	SF	Negative
jns	\sim SF	Nonnegative
jg	\sim (SF \wedge OF) & \sim ZF	Greater (Signed)
jge	\sim (SF \wedge OF)	Greater or Equal (Signed)
jl	(SF \wedge OF)	Less (Signed)
jle	(SF \wedge OF) ZF	Less or Equal (Signed)
ja	\sim CF & \sim ZF	Above (unsigned)
jb	CF	Below (unsigned)

Branch statements

```
1 unsigned long absdiff_ternary (  
2     unsigned long x, unsigned long y ){  
3     return x<y ? y-x : x-y;  
4 }
```

```
1 unsigned long absdiff_if_else (  
2     unsigned long x, unsigned long y ){  
3     if (x<y) return y-x;  
4     else return x-y;  
5 }
```

```
1 unsigned long absdiff_goto (  
2     unsigned long x, unsigned long y ){  
3     if (!(x<y)) goto Else;  
4     return y-x;  
5     Else:  
6     return x-y;  
7 }
```

All C functions above translate
(-fno-if-conversion) to assembly at right.

```
absdiff_if_else:  
absdiff_goto:  
    cmpq %rsi, %rdi  
    jnb .ELSE  
    movq %rsi, %rax  
    subq %rdi, %rax  
    ret  
.ELSE:  
    movq %rdi, %rax  
    subq %rsi, %rax  
    ret
```

Explanation

- ▶ `cmpq %rsi, %rdi`: Calculates $\%rdi - \%rsi$ ($x - y$), sets condition codes.
- ▶ `jnb .ELSE`: Sets program counter / instruction pointer in `%rip` (`.ELSE`) if CF flag not set indicating no unsigned overflow.
