Deutsch-Jozsa algorithm: simplest quantum algorithm showing advantage vs. classical

Problem description Circuit diagram and what is in the oracle Demonstration of Deutsch-Jozsa for the n = 1 case Deutsch-Jozsa programs and systems

#### The class so far

- 1. Be sure to keep up with class via session slides and recommended reading.
- 2. Practice quantum computing formalism: state vectors, unitary matrices, tensor products.

## Intermediate-term class plan

#### Where we are headed in first month

- 1. Fundamental rules of quantum computing
- 2. Basic quantum algorithms
- 3. Programming examples in Google Cirq
- 4. A NISQ algorithm: quantum approximate optimization algorithm
- 5. Programming assignment on QAOA in Cirq

Deutsch-Jozsa algorithm: simplest quantum algorithm showing advantage vs. classical

(ロ)、(同)、(目)、(目)、(目)、(10/19)

Problem description Circuit diagram and what is in the oracle Demonstration of Deutsch-Jozsa for the n = 1 case Deutsch-Jozsa programs and systems Deutsch-Jozsa algorithm: simplest quantum algorithm showing advantage vs. classical

#### A Heist

- You break into a bank vault. The bank vault has 2<sup>n</sup> bars. Three possibilities: all are gold, half are gold and half are fake, or all are fake.
- Even if you steal just one gold bar, it is enough to fund your escape from the country, forever evading law enforcement.

(ロ)、(同)、(目)、(目)、(目)、(1)/19

- > You do not want to risk stealing from a bank vault with only fake bars.
- You have access to an oracle f(x) that tells you if gold bar x is real.
- Using the oracle sounds the alarm, so you only get to use it once.

Deutsch-Jozsa algorithm: simplest quantum algorithm showing advantage vs. classical

#### More formal description

- The  $2^n$  bars are either fake or gold.  $f : \{0,1\}^n \to \{0,1\}$ .
- ► Three possibilities:
  - 1. All are fake. *f* is constant. f(x) = 0 for all  $x \in \{0, 1\}^n$ .
  - 2. All are gold. *f* is constant. f(x) = 1 for all  $x \in \{0, 1\}^n$ .
  - 3. Half fake half gold. f is balanced.

$$\left| \{ x \in \{0,1\}^n : f(x) = 0 \} \right| = \left| \{ x \in \{0,1\}^n : f(x) = 1 \} \right| = 2^{n-1}$$

- The oracle *U* works as follows:  $U |c\rangle |t\rangle = |c\rangle |t \oplus f(c)\rangle$
- ▶ Try deciding if *f* is constant or balanced using oracle *U* only once.

## Circuit diagram

Compare to diagram in Rudolph, "Q is for Quantum".

### What is in the oracle

Output of circuit is c = 0 iff f is constant

1. Initial state:  $|c\rangle \otimes |t\rangle = |0\rangle \otimes |1\rangle = |0\rangle |1\rangle = |01\rangle$ 

2. After first set of Hadamards:  $H \otimes H\left( |0\rangle \otimes |1\rangle \right) = H |0\rangle \otimes H |1\rangle = |+\rangle \otimes |-\rangle = \left(\frac{1}{\sqrt{2}}|0\rangle + \frac{1}{\sqrt{2}}|1\rangle\right) \otimes \left(\frac{1}{\sqrt{2}}|0\rangle - \frac{1}{\sqrt{2}}|1\rangle\right) = \frac{1}{2} \begin{bmatrix} 1\\ -1\\ 1\\ -1 \end{bmatrix}$ 

From here, let's take an aside via matrix-vector multiplication to build intuition with interference and phase kickback.

(ロ)、(同)、(目)、(目)、(目)、(15/19)

Output of circuit is c = 0 iff f is constant

- 1. Initial state:  $|c\rangle \otimes |t\rangle = |0\rangle \otimes |1\rangle = |0\rangle |1\rangle = |01\rangle$
- 2. After first set of Hadamards:  $H \otimes H\left( |0\rangle \otimes |1\rangle \right) = |+\rangle |-\rangle =$

$$\left(\frac{1}{\sqrt{2}}\left|0\right\rangle + \frac{1}{\sqrt{2}}\left|1\right\rangle\right) \left(\frac{1}{\sqrt{2}}\left|0\right\rangle - \frac{1}{\sqrt{2}}\left|1\right\rangle\right) = \frac{1}{2} \left(\left|0\right\rangle\left(\left|0\right\rangle - \left|1\right\rangle\right) + \left|1\right\rangle\left(\left|0\right\rangle - \left|1\right\rangle\right)\right)$$

3. After applying oracle *U*:  $U_{\frac{1}{2}}\left(|0\rangle \left(|0\rangle - |1\rangle\right) + |1\rangle \left(|0\rangle - |1\rangle\right)\right) = \frac{1}{2}\left(|0\rangle \left(|f(0) \oplus 0\rangle - |f(0) \oplus 1\rangle\right) + |1\rangle \left(|f(1) \oplus 0\rangle - |f(1) \oplus 1\rangle\right)\right) = \frac{1}{2}\left(|0\rangle \left(|f(0)\rangle - |f(\bar{0})\rangle\right) + |1\rangle \left(|f(1)\rangle - |f(\bar{1})\rangle\right)\right)$ 

Output of circuit is c = 0 iff f is constant

- 1. Initial state:  $|c\rangle \otimes |t\rangle = |0\rangle \otimes |1\rangle = |0\rangle |1\rangle = |01\rangle$
- 2. After first set of Hadamards:  $\frac{1}{2} \left( |0\rangle (|0\rangle |1\rangle) + |1\rangle (|0\rangle |1\rangle) \right)$
- 3. After applying oracle  $U: U_{\overline{2}}^{1} \left( |0\rangle (|0\rangle |1\rangle) + |1\rangle (|0\rangle |1\rangle) \right) = \frac{1}{2} \left( |0\rangle \left( |f(0)\rangle |f(\overline{0})\rangle \right) + |1\rangle \left( |f(1)\rangle |f(\overline{1})\rangle \right) \right)$
- 4. This last expression can be factored depending on *f*:  $U\frac{1}{2}\left(|0\rangle (|0\rangle - |1\rangle) + |1\rangle (|0\rangle - |1\rangle)\right) = \begin{cases} \frac{1}{2}(|0\rangle + |1\rangle) (|f(0)\rangle - |f(\overline{0})\rangle) & \text{if } f(0) = f(1) \\ \frac{1}{2}(|0\rangle - |1\rangle) (|f(0)\rangle - |f(\overline{0})\rangle) & \text{if } f(0) \neq f(1) \end{cases} = \begin{cases} |+\rangle|-\rangle & \text{if } f(0) = f(1) \\ |-\rangle|-\rangle & \text{if } f(0) \neq f(1) \end{cases}$

The trick where oracle's output on  $|t\rangle$  affects phase of  $|c\rangle$  is called phase kickback.

17/19

Output of circuit is c = 0 iff f is constant

- 1. Initial state:  $|c\rangle\otimes|t\rangle=|0\rangle\otimes|1\rangle=|0\rangle|1\rangle=|01\rangle$
- 2. After first set of Hadamards:  $\frac{1}{2} \left( |0\rangle (|0\rangle |1\rangle) + |1\rangle (|0\rangle |1\rangle) \right)$
- 3. After applying oracle *U*:

$$U_{\frac{1}{2}}\left(\left.\left|0\right\rangle\left(\left|0\right\rangle-\left|1\right\rangle\right)+\left|1\right\rangle\left(\left|0\right\rangle-\left|1\right\rangle\right)\right)=\begin{cases}\left|+\right\rangle\left|-\right\rangle \text{ if } f(0)=f(1)\\\left|-\right\rangle\left|-\right\rangle \text{ if } f(0)\neq f(1)\end{cases}$$

(ロト (同) (目) (目) (目) (18/19)

4. After applying second *H* on top qubit:  $\begin{cases}
H \otimes I(|+\rangle |-\rangle) = |0\rangle |-\rangle & \text{if } f(0) = f(1) \\
H \otimes I(|-\rangle |-\rangle) = |1\rangle |-\rangle & \text{if } f(0) \neq f(1)
\end{cases}$
