More formal description

- The $2^n$ bars are either fake or gold. $f : \{0, 1\}^n \to \{0, 1\}$.
- Three possibilities:
  1. All are fake. $f$ is constant. $f(x) = 0$ for all $x \in \{0, 1\}^n$.
  2. All are gold. $f$ is constant. $f(x) = 1$ for all $x \in \{0, 1\}^n$.
  3. Half fake half gold. $f$ is balanced.

\[
\left| \{x \in \{0, 1\}^n : f(x) = 0\} \right| = \left| \{x \in \{0, 1\}^n : f(x) = 1\} \right| = 2^{n-1}
\]
- The oracle $U$ works as follows: $U |c\rangle |t\rangle = |c\rangle |t \oplus f(c)\rangle$
- Try deciding if $f$ is constant or balanced using oracle $U$ only once.

Deutsch’s algorithm: Deutsch-Jozsa for the $n = 1$ case

Output of circuit is $c = 0$ iff $f$ is constant

1. Initial state: $|c\rangle \otimes |t\rangle = |0\rangle \otimes |1\rangle = |0\rangle |1\rangle = |01\rangle$

2. After first set of Hadamards: $H \otimes H\left(|0\rangle \otimes |1\rangle\right) = H |0\rangle \otimes H |1\rangle = |+\rangle \otimes |−\rangle = \left(\frac{1}{\sqrt{2}} |0\rangle + \frac{1}{\sqrt{2}} |1\rangle\right) \otimes \left(\frac{1}{\sqrt{2}} |0\rangle - \frac{1}{\sqrt{2}} |1\rangle\right) = \frac{1}{2} \begin{bmatrix} 1 \\ -1 \\ 1 \\ -1 \end{bmatrix}$

From here, let’s take an aside via matrix-vector multiplication to build intuition with interference and phase kickback.
Deutsch’s algorithm: Deutsch-Jozsa for the \( n = 1 \) case

Output of circuit is \( c = 0 \) iff \( f \) is constant

1. Initial state: \( |c\rangle \otimes |t\rangle = |0\rangle \otimes |1\rangle = |0\rangle |1\rangle = |01\rangle \)

2. After first set of Hadamards: \( \frac{1}{2} \left( |0\rangle \left( |0\rangle - |1\rangle \right) + |1\rangle \left( |0\rangle - |1\rangle \right) \right) \)

3. After applying oracle \( U: U \frac{1}{2} \left( |0\rangle \left( |0\rangle - |1\rangle \right) + |1\rangle \left( |0\rangle - |1\rangle \right) \right) = \frac{1}{2} \left( |0\rangle \left( |f(0)\rangle - |f(\bar{0})\rangle \right) + |1\rangle \left( |f(1)\rangle - |f(\bar{1})\rangle \right) \right) \)

4. This last expression can be factored depending on \( f \):
\[
\frac{1}{2} \left( |0\rangle \left( |f(0)\rangle - |f(\bar{0})\rangle \right) + |1\rangle \left( |f(1)\rangle - |f(\bar{1})\rangle \right) \right) =
\begin{cases} 
\frac{1}{2} \left( |0\rangle + |1\rangle \right) \left( |f(0)\rangle - |f(\bar{0})\rangle \right) & \text{if } f(0) = f(1) \\
\frac{1}{2} \left( |0\rangle - |1\rangle \right) \left( |f(0)\rangle - |f(\bar{0})\rangle \right) & \text{if } f(0) \neq f(1)
\end{cases}
\]

The trick where oracle’s output on \( |t\rangle \) affects phase of \( |c\rangle \) is called phase kickback.
Deutsch’s algorithm: Deutsch-Jozsa for the $n = 1$ case

Output of circuit is $c = 0$ iff $f$ is constant

1. Initial state: $|c\rangle \otimes |t\rangle = |0\rangle \otimes |1\rangle = |0\rangle |1\rangle = |01\rangle$

2. After first set of Hadamards: $\frac{1}{2} \left( |0\rangle \left( |0\rangle - |1\rangle \right) + |1\rangle \left( |0\rangle - |1\rangle \right) \right)$

3. After applying oracle $U$:

$$U^{\frac{1}{2}} \left( |0\rangle \left( |0\rangle - |1\rangle \right) + |1\rangle \left( |0\rangle - |1\rangle \right) \right) = \begin{cases} |+\rangle |-\rangle & \text{if } f(0) = f(1) \\ |-\rangle |-\rangle & \text{if } f(0) \neq f(1) \end{cases}$$

4. After applying second $H$ on top qubit:

$$\begin{cases} H \otimes I \left( |+\rangle |-\rangle \right) = |0\rangle |-\rangle & \text{if } f(0) = f(1) \\ H \otimes I \left( |-\rangle |-\rangle \right) = |1\rangle |-\rangle & \text{if } f(0) \neq f(1) \end{cases}$$

The Deutsch-Jozsa algorithm circuit

Compare to diagram in Rudolph, "Q is for Quantum".
Recall Multiple qubits: the tensor product

Exercise: proof by induction about the Hadamard transform
Show that $|+\rangle \otimes^n = \frac{1}{2^{n/2}} \sum_{c=0}^{2^n-1} |c\rangle$

- Base case $n = 1$: $|+\rangle \otimes^1 = |+\rangle = \frac{1}{\sqrt{2}} |0\rangle + \frac{1}{\sqrt{2}} |1\rangle = \frac{1}{2^{1/2}} \sum_{c=0}^{1-1} |c\rangle$

- Inductive step assumes statement is true for $n = k - 1$. Then for $n = k$:

$|+\rangle \otimes^k = |+\rangle \otimes |+\rangle^{k-1} = \frac{1}{\sqrt{2}} (|0\rangle + |1\rangle) \otimes \frac{1}{2^{(k-1)/2}} \sum_{c=0}^{2^{k-1}-1} |c\rangle = $

$$\frac{1}{2^{1/2}} \begin{bmatrix} 1 \\ \vdots \\ 1 \end{bmatrix} \otimes \frac{1}{2^{(k-1)/2}} \begin{bmatrix} 1 \\ \vdots \\ 1 \end{bmatrix}^{2^{k-1} \times 1} = \frac{1}{2^{k/2}} \begin{bmatrix} 1 \\ \vdots \\ 1 \end{bmatrix}^{2^k \times 1}$$

$$

$$
= \frac{1}{2^{n/2}} \sum_{c=0}^{2^n-1} (-1)^{f(c)} |c\rangle \otimes \left( \frac{|0\rangle - |1\rangle}{\sqrt{2}} \right)
$$
