Unraveling the compilation chain

Carnegie Mellon

Turning C into Object Code

- Code in files `p1.c` `p2.c`
- Compile with command: `gcc -Og p1.c p2.c -o p`
 - Use basic optimizations (`-Og`) [New to recent versions of GCC]
 - Put resulting binary in file `p`

▶ `gcc -Og -S swap.c`

▶ `objdump -d swap`

Let's go to CS:APP textbook lecture slides (05-machine-basics.pdf) slide 28

Data movement instructions

Does unsigned / signed matter?

1. `void swap_uc ( unsigned char*a, unsigned char*b );`
2. `void swap_sc ( signed char*a, signed char*b );`

Swapping different data sizes

1. `void swap_c ( char*a, char*b );`
2. `void swap_s ( short*a, short*b );`
3. `void swap_i ( int*a, int*b );`
4. `void swap_l ( long*a, long*b );`

Data size and x86 / x86-64 registers

Assembly syntax

Instruction Source, Dest

```
swap_l:  
    movq (%rsi), %rax  
    movq (%rdi), %rdx  
    movq %rdx, (%rsi)  
    movq %rax, (%rdi)  
    ret
```

swap	data type	mov operation	registers
swap_uc	unsigned char	movb (move byte)	%al, %dl
swap_sc	signed char	movb (move byte)	%al, %dl
swap_c	char	movb (move byte)	%al, %dl
swap_s	short	movw (move word)	%ax, %dx
swap_i	int	movl	%eax, %edx
swap_l	long	movq	%rax, %rdx

Data size and IA32, x86, and x86-64 registers

Some History: IA32 Registers

data type	registers
char	%al, %dl
short	%ax, %dx
int	%eax, %edx
long	%rax, %rdx

Note the backward compatibility.

Data size and IA32, x86, and x86-64 registers

x86-64 Integer Registers

data type	registers
char	%al, %dl
short	%ax, %dx
int	%eax, %edx
long	%rax, %rdx

Note the backward compatibility.

%rax	%eax	%r8	%r8d
%rbx	%ebx	%r9	%r9d
%rcx	%ecx	%r10	%r10d
%rdx	%edx	%r11	%r11d
%rsi	%esi	%r12	%r12d
%rdi	%edi	%r13	%r13d
%rsp	%esp	%r14	%r14d
%rbp	%ebp	%r15	%r15d

- Can reference low-order 4 bytes (also low-order 1 & 2 bytes)

Data size and IA32, x86, and x86-64 registers

Sign extension due to unsigned and signed data types

Converting to a data type with more bits

```
1 unsigned short uc_to_us (  
2     unsigned char input  
3 ) {  
4     return input;  
5 }
```

```
1 signed short sc_to_ss (  
2     signed char input  
3 ) {  
4     return input;  
5 }
```

$$\begin{aligned} 255 &= 1111_1111_2 \\ &= 0000_0000_1111_1111_2 \\ &= 255 \end{aligned}$$

$$\begin{aligned} 127 &= 0111_1111_2 \\ &= 0000_0000_0111_1111_2 \\ &= 127 \end{aligned}$$

$$\begin{aligned} -128 &= 1000_0000_2 \\ &= 1111_1111_1000_0000_2 \\ &= -128 \end{aligned}$$

Sign extension due to unsigned and signed data types

Converting to a data type with more bits

```
1 unsigned short uc_to_us (  
2     unsigned char input  
3 ) {  
4     return input;  
5 }
```

```
1 signed short sc_to_ss (  
2     signed char input  
3 ) {  
4     return input;  
5 }
```

function signature	assembly code
unsigned short uc_to_us (unsigned char input);	movzbl %dil, %eax
signed short uc_to_ss (unsigned char input);	movzbl %dil, %eax
unsigned short sc_to_us (signed char input);	movsbw %dil, %ax
signed short sc_to_ss (signed char input);	movsbw %dil, %ax

- ▶ movz: zero extension in the MSBs
- ▶ movs: signed extension in the MSBs

- Integer arithmetic operations

`2_addressing_modes.s`: Understanding source dest operands and memory addressing modes

`3_leaq.s`: Borrowing memory address calculation to efficiently implement arithmetic

Comparisons and program control flow

- What is control flow?

- Condition codes

- Comparison and set instructions

Modifying control flow via conditional branch statements

- Jump instructions

Left shift operation

```
1 unsigned long sl_ul (  
2     unsigned long in0,  
3     unsigned long in1  
4 ) {  
5     return in0<<in1;  
6 }
```

```
1 signed long sl_sl (  
2     signed long in0,  
3     signed long in1  
4 ) {  
5     return in0<<in1;  
6 }
```

Both C code functions above translate to the assembly on the right.

```
sl_ul:  
sl_sl:  
    movq %rdi, %rax  
    movb %sil, %cl  
    salq %cl, %rax  
    ret
```

Explanation

- ▶ `movq: in0 → %rdi → %rax`
- ▶ `movb: in1 → %sil → %cl`
- ▶ `salq src, dest:`
`(dest << src) → dest`
- ▶ Why only use `movb` for `in1`?

Right shift operation

Right shift of unsigned types yields logical (zero-filled) right shift

```
1 unsigned long sr_ul (  
2     unsigned long in0,  
3     unsigned long in1  
4 ) {  
5     return in0>>in1;  
6 }
```

```
sr_ul:  
    movq %rdi, %rax  
    movb %sil, %cl  
    shrq %cl, %rax  
    ret
```

Right shift of signed types yields arithmetic (sign-extended) right shift

```
1 signed long sr_sl (  
2     signed long in0,  
3     signed long in1  
4 ) {  
5     return in0>>in1;  
6 }
```

```
sr_sl:  
    movq %rdi, %rax  
    movb %sil, %cl  
    sarq %cl, %rax  
    ret
```

Bitwise operations

Assembly instruction	Instruction effect
<code>notq dest</code>	$\sim \text{dest} \rightarrow \text{dest}$
<code>andq src, dest</code>	$\text{src} \& \text{dest} \rightarrow \text{dest}$
<code>orq src, dest</code>	$\text{src} \text{dest} \rightarrow \text{dest}$
<code>xorq src, dest</code>	$\text{src} \wedge \text{dest} \rightarrow \text{dest}$

Integer arithmetic operations

Assembly instruction	Instruction effect
<code>incq dest</code>	$\text{dest} + 1 \rightarrow \text{dest}$
<code>decq dest</code>	$\text{dest} - 1 \rightarrow \text{dest}$
<code>negq dest</code>	$-\text{dest} \rightarrow \text{dest}$
<code>addq src, dest</code>	$\text{src} + \text{dest} \rightarrow \text{dest}$
<code>subq src, dest</code>	$\text{src} - \text{dest} \rightarrow \text{dest}$
<code>imulq src, dest</code>	$\text{src} \times \text{dest} \rightarrow \text{dest}$

Immediate, register, and memory

Immediate

Constant integer values. Example: `2_addressing_modes.c` `immediate()`

Register

One of the registers of appropriate size for data type. Example: `1_swap.c`

Memory

Access to memory at calculated

`movq` Operand Combinations

	Source	Dest	Src, Dest	C Analog
<code>movq</code>	<i>Imm</i>	<i>Reg</i>	<code>movq \$0x4, %rax</code>	<code>temp = 0x4;</code>
		<i>Mem</i>	<code>movq \$-147, (%rax)</code>	<code>*p = -147;</code>
	<i>Reg</i>	<i>Reg</i>	<code>movq %rax, %rdx</code>	<code>temp2 = temp1;</code>
		<i>Mem</i>	<code>movq %rax, (%rdx)</code>	<code>*p = temp;</code>
	<i>Mem</i>	<i>Reg</i>	<code>movq (%rax), %rdx</code>	<code>temp = *p;</code>

Cannot do memory-memory transfer with a single instruction

Simple Memory Addressing Modes

■ Normal (R) Mem[Reg[R]]

- Register R specifies memory address
- Aha! Pointer dereferencing in C

```
movq (%rcx), %rax
```

■ Displacement D(R) Mem[Reg[R]+D]

- Register R specifies start of memory region
- Constant displacement D specifies offset

```
movq 8(%rbp), %rdx
```

Normal

Simple pointers.

Example: 2_addressing_modes.c
immediate()

Displacement

Array access with constant index.

Example: 2_addressing_modes.c
displacement()

Complete Memory Addressing Modes

■ Most General Form

$D(Rb, Ri, S)$ $Mem[Reg[Rb] + S * Reg[Ri] + D]$

- D: Constant “displacement” 1, 2, or 4 bytes
- Rb: Base register: Any of 16 integer registers
- Ri: Index register: Any, except for `%rsp`
- S: Scale: 1, 2, 4, or 8 (*why these numbers?*)

■ Special Cases

(Rb, Ri) $Mem[Reg[Rb] + Reg[Ri]]$

$D(Rb, Ri)$ $Mem[Reg[Rb] + Reg[Ri] + D]$

(Rb, Ri, S) $Mem[Reg[Rb] + S * Reg[Ri]]$

Indexed

Array access with variable index.

Example: `2_addressing_modes.c`
`index()`

Address Computation Examples

<code>%rdx</code>	<code>0xf000</code>
<code>%rcx</code>	<code>0x0100</code>

Expression	Address Computation	Address
<code>0x8(%rdx)</code>	<code>0xf000 + 0x8</code>	<code>0xf008</code>
<code>(%rdx,%rcx)</code>	<code>0xf000 + 0x100</code>	<code>0xf100</code>
<code>(%rdx,%rcx,4)</code>	<code>0xf000 + 4*0x100</code>	<code>0xf400</code>
<code>0x80(,%rdx,2)</code>	<code>2*0xf000 + 0x80</code>	<code>0x1e080</code>

2_addressing_modes.c: Imm→Mem

C code

```
void immediate ( long * ptr ) {  
    *ptr = 0xFFFFFFFFFFFFFFFF;  
}
```

Assembly code

```
immediate:  
    movq $-1, (%rdi)  
    ret
```

- ▶ \$ indicates the immediate value; corresponds to literals in C
- ▶ (%rdi) indicates memory location at address stored in %rdi register

2_addressing_modes.c: Imm→Mem (with displacement)

C code

```
void displacement_l ( long * ptr ) {  
    ptr[1] = 0xFFFFFFFFFFFFFFFF;  
}
```

- ▶ 8(%rdi) indicates memory location at address stored in %rdi register + 8

Assembly code

```
displacement_l:  
    movq $-1, 8(%rdi)  
    ret
```

2_addressing_modes.c: Imm→Mem (with displacement)

function signature	assembly code
<code>void displacement_c (char * ptr);</code>	<code>movb \$-1, 1(%rdi)</code>
<code>void displacement_s (short * ptr);</code>	<code>movw \$-1, 2(%rdi)</code>
<code>void displacement_i (int * ptr);</code>	<code>movl \$-1, 4(%rdi)</code>
<code>void displacement_l (long * ptr);</code>	<code>movq \$-1, 8(%rdi)</code>

2_addressing_modes.c: Imm→Mem (with index)

C code

```
void index_l ( long * ptr, long index ) {  
    ptr[index] = 0xFFFFFFFFFFFFFFFF;  
}
```

► (%rdi,%rsi,8) indicates memory location at address stored in %rdi register + $8 \times$ value stored in %rsi register

Assembly code

```
index_l:  
    movq $-1, (%rdi,%rsi,8)  
    ret
```

2_addressing_modes.c: Imm→Mem (with index)

function signature	assembly code
<code>void index_c (char * ptr, long index);</code>	<code>movb \$-1, (%rdi,%rsi)</code>
<code>void index_s (short * ptr, long index);</code>	<code>movw \$-1, (%rdi,%rsi,2)</code>
<code>void index_i (int * ptr, long index);</code>	<code>movl \$-1, (%rdi,%rsi,4)</code>
<code>void index_l (long * ptr, long index);</code>	<code>movq \$-1, (%rdi,%rsi,8)</code>

2_addressing_modes.c: Imm→Mem (with displacement and index)

C code

```
void displacement_and_index ( long * ptr, long index ) {  
    ptr[index+1] = 0xFFFFFFFFFFFFFFFF;  
}
```

► 8(%rdi,%rsi,8) indicates memory location at address stored in %rdi register + $8 \times$ value stored in %rsi register + 8

Assembly code

```
displacement_and_index:  
    movq $-1, 8(%rdi,%rsi,8)  
    ret
```

3_leaq.s: Borrowing memory address calculation to efficiently implement arithmetic

Carnegie Mellon

Address Computation Instruction

■ leaq Src, Dst

- Src is address mode expression
- Set Dst to address denoted by expression

■ Uses

- Computing addresses without a memory reference
 - E.g., translation of `p = &x[i];`
- Computing arithmetic expressions of the form $x + k*y$
 - $k = 1, 2, 4, \text{ or } 8$

■ Example

```
long m12(long x)
{
    return x*12;
}
```

Converted to ASM by compiler:

```
leaq (%rdi,%rdi,2), %rax # t <- x*x*2
salq $2, %rax           # return t<<2
```

Example: 3_leaq.c

Load effective address

```
1 long * leaq (  
2     long * ptr, long index  
3 ) {  
4     return &ptr[index+1];  
5 }
```

```
1 long mulAdd (  
2     long base, long index  
3 ) {  
4     return base+index*8+8;  
5 }
```

Both C code functions above translate to the assembly on the right.

leaq:

mulAdd:

```
leaq 8(%rdi,%rsi,8), %rax  
ret
```

Explanation

- ▶ `leaq src, dest` takes the effective address of the memory (index, displacement) expression of `src` and puts it in `dest`.
- ▶ `leaq` has shorter latency (takes fewer CPU cycles) than `imulq`, so GCC will use `leaq` whenever it can to calculate expressions like $y + ax + b$.

Modifying control flow via conditional branch statements

- Jump instructions

What is control flow?

Control flow is:

- ▶ Change in the sequential execution of instructions.
- ▶ Change in the steady incrementation of the program counter / instruction pointer (%rip register).

Control primitives in assembly build up to enable C and Java control statements:

- ▶ if-else statements
- ▶ do-while loops
- ▶ while loops
- ▶ for loops
- ▶ switch statements

Assembly/Machine Code View

Programmer-Visible State

- **PC: Program counter**

- Address of next instruction
- Called "RIP" (x86-64)

- **Register file**

- Heavily used program data

- **Condition codes**

- Store status information about most recent arithmetic or logical operation
- Used for conditional branching

- **Memory**

- Byte addressable array
- Code and user data
- Stack to support procedures

Condition codes

Automatically set by most arithmetic instructions.

Applicable types	Condition code	Name	Use
Signed and unsigned	ZF	Zero flag	The most recent operation yielded zero.
Unsigned types	CF	Carry flag	The most recent operation generated a carry out of the most significant bit. Used to detect overflow for unsigned operations
Signed types	SF	Sign flag	The most recent operation yielded a negative value.
Signed types	OF	Overflow flag	The most recent operation yielded a two's complement positive or negative overflow.

Table: Condition codes important for control flow

Comparison instructions

```
cmpq source1, source2
```

Performs $\text{source2} - \text{source1}$, and sets the condition codes without setting any destination register.

Test for equality

```
1 short equal_sl (  
2     long x,  
3     long y  
4 ) {  
5     return x==y;  
6 }
```

C code function above translates to the assembly on the right.

```
equal_sl:  
    xorl %eax, %eax  
    cmpq %rsi, %rdi  
    sete %al  
    ret
```

Explanation

- ▶ `xorl %eax, %eax`: Zeros the 32-bit register `%eax`.
- ▶ `cmpq %rsi, %rdi`: Calculates $\%rdi - \%rsi$ ($x - y$), sets condition codes without updating any destination register.
- ▶ `sete %al`: Sets the 8-bit `%al` subset of `%eax` if op yielded zero.

Test if unsigned x is below unsigned y

```
1 short below_ul (  
2     unsigned long x,  
3     unsigned long y  
4 ) {  
5     return x<y;  
6 }
```

```
1 short nae_ul (  
2     unsigned long x,  
3     unsigned long y  
4 ) {  
5     return !(x>=y);  
6 }
```

Both C code functions above translate to the assembly on the right.

```
below_ul:  
nae_ul:  
    xorl %eax, %eax  
    cmpq %rsi, %rdi  
    setb %al  
    ret
```

Explanation

- ▶ `xorl %eax, %eax`: Zeros %eax.
- ▶ `cmpq %rsi, %rdi`: Calculates $\%rdi - \%rsi$ ($x - y$), sets condition codes without updating any destination register.
- ▶ `setb %al`: Sets %al if CF flag set indicating unsigned overflow.

Side review: De Morgan's laws

► $\neg A \wedge \neg B \iff \neg(A \vee B)$

► $(\sim A) \& (\sim B) \iff \sim (A|B)$

Set instructions

`cmp source1, source2` performs $\text{source2} - \text{source1}$, sets condition codes.

Applicable types	Set instruction	Logical condition	Intutive condition
Signed and unsigned	sete / setz	ZF	Equal / zero
Signed and unsigned	setne / setnz	$\sim$ ZF	Not equal / not zero
Unsigned	setb / setnae	CF	Below
Unsigned	setbe / setna	CF ZF	Below or equal
Unsigned	seta / setnbe	$\sim$ CF & $\sim$ ZF	Above
Unsigned	setnb / setae	$\sim$ CF	Above or equal
Signed	sets	SF	Negative
Signed	setns	$\sim$ SF	Nonegative
Signed	setl / setnge	SF ^ OF	Less than
Signed	setle / setng	(SF ^ OF) ZF	Less than or equal
Signed	setg / setnle	$\sim$ (SF ^ OF) & $\sim$ ZF	Greater than
Signed	setge / setnl	$\sim$ (SF ^ OF)	Greater than or equal

Modifying control flow via conditional branch statements

- Jump instructions

Jumping

■ jX Instructions

- Jump to different part of code depending on condition codes

jX	Condition	Description
jmp	1	Unconditional
j _e	ZF	Equal / Zero
j _{ne}	$\sim$ ZF	Not Equal / Not Zero
j _s	SF	Negative
j _{ns}	$\sim$ SF	Nonnegative
j _g	$\sim (SF \wedge OF) \ \& \ \sim ZF$	Greater (Signed)
j _{ge}	$\sim (SF \wedge OF)$	Greater or Equal (Signed)
j _l	$(SF \wedge OF)$	Less (Signed)
j _{le}	$(SF \wedge OF) \ \ ZF$	Less or Equal (Signed)
j _a	$\sim CF \ \& \ \sim ZF$	Above (unsigned)
j _b	CF	Below (unsigned)

Branch statements

```
1 unsigned long absdiff_ternary (  
2     unsigned long x, unsigned long y ){  
3     return x<y ? y-x : x-y;  
4 }
```

```
1 unsigned long absdiff_if_else (  
2     unsigned long x, unsigned long y ){  
3     if (x<y) return y-x;  
4     else return x-y;  
5 }
```

```
1 unsigned long absdiff_goto (  
2     unsigned long x, unsigned long y ){  
3     if (!(x<y)) goto Else;  
4     return y-x;  
5     Else:  
6     return x-y;  
7 }
```

All C functions above translate
(-fno-if-conversion) to assembly at right.

```
absdiff_if_else:  
absdiff_goto:  
    cmpq %rsi, %rdi  
    jnb .ELSE  
    movq %rsi, %rax  
    subq %rdi, %rax  
    ret  
.ELSE:  
    movq %rdi, %rax  
    subq %rsi, %rax  
    ret
```

Explanation

- ▶ `cmpq %rsi, %rdi`: Calculates $\%rdi - \%rsi$ ($x - y$), sets condition codes.
- ▶ `jnb .ELSE`: Sets program counter / instruction pointer in `%rip` (.ELSE) if CF flag not set indicating no unsigned overflow.

Modifying control flow via conditional branch statements

- Jump instructions

Conditional move statements

```
1 unsigned long absdiff_ternary (  
2     unsigned long x, unsigned long y ){  
3     return x<y ? y-x : x-y;  
4 }
```

```
1 unsigned long absdiff_if_else (  
2     unsigned long x, unsigned long y ){  
3     if (x<y) return y-x;  
4     else return x-y;  
5 }
```

```
1 unsigned long absdiff_goto (  
2     unsigned long x, unsigned long y ){  
3     if (!(x<y)) goto Else;  
4     return y-x;  
5     Else:  
6     return x-y;  
7 }
```

All C functions above translate
(-fif-conversion or -O1) to assembly at

absdiff_ternary:

absdiff_if_else:

absdiff_goto:

```
    movq %rsi, %rdx // y  
    subq %rdi, %rdx // y-x  
    movq %rdi, %rax // x  
    subq %rsi, %rax // x-y  
    cmpq %rsi, %rdi  
    cmovb %rdx, %rax  
    ret
```

Explanation

- ▶ `cmpq %rsi, %rdi`: Calculates $\%rdi - \%rsi$ ($x - y$), sets condition codes.
- ▶ `jnb .ELSE`: Sets program counter / instruction pointer in `%rip` (.ELSE) if CF flag not set indicating no unsigned overflow.

Modifying control flow vs. data flow in deep CPU pipelines

Modifying control flow via conditional branch statements

- Jump instructions

Compiling for loops to while loops

C loop statements such as for loops, while loops, and do-while loops do not exist in assembly. They are instead constructed from conditional jump statements.

```
1 unsigned long count_bits_for (
2     unsigned long number
3 ) {
4     unsigned long tally = 0;
5     for (
6         int shift=0; // init
7         shift<8*sizeof(unsigned long); // ←
8         test
9         shift++; // update
10    ) {
11        // body
12        tally += 0b1 & number>>shift;
13    }
14    return tally;
15 }
```

```
1 unsigned long count_bits_while (
2     unsigned long number
3 ) {
4     unsigned long tally = 0;
5     int shift=0; // init
6     while (
7         shift<8*sizeof(unsigned long) // ←
8         test
9    ) {
10        // body
11        tally += 0b1 & number>>shift;
12        shift++; // update
13    }
14    return tally;
15 }
```

Compiling while loops to do-while loops

```
1 unsigned long count_bits_while (  
2     unsigned long number  
3 ) {  
4     unsigned long tally = 0;  
5     int shift=0; // init  
6     while (  
7         shift<8*sizeof(unsigned long) // ←  
8         test  
9     ) {  
10        // body  
11        tally += 0b1 & number>>shift;  
12        shift++; // update  
13    }  
14    return tally;  
}
```

```
1 unsigned long count_bits_do_while (  
2     unsigned long number  
3 ) {  
4     unsigned long tally = 0;  
5     int shift=0; // init  
6     do {  
7         // body  
8         tally += 0b1 & number>>shift;  
9         shift++; // update  
10    } while (shift<8*sizeof(unsigned long) ←  
11             )); // test  
11    return tally;  
12 }
```

If initial iteration is guaranteed to run, then do one fewer test.

Compiling do-while loops to goto statements

```
1 unsigned long count_bits_do_while (  
2     unsigned long number  
3 ) {  
4     unsigned long tally = 0;  
5     int shift=0; // init  
6     do {  
7         // body  
8         tally += 0b1 & number>>shift;  
9         shift++; // update  
10    } while (shift<8*sizeof(unsigned long)↵  
        ); // test  
11    return tally;  
12 }
```

```
1 unsigned long count_bits_goto (  
2     unsigned long number  
3 ) {  
4     unsigned long tally = 0;  
5     int shift=0; // init  
6 LOOP:  
7     // body  
8     tally += 0b1 & number>>shift;  
9     shift++; // update  
10    if (shift<8*sizeof(unsigned long)) { ↵  
        // test  
11        goto LOOP;  
12    }  
13    return tally;  
14 }
```

Loops get compiled into goto statements which are readily translated to assembly.

Compiling goto statements to assembly conditional jump instructions

```
1 unsigned long count_bits_goto (  
2     unsigned long number  
3 ) {  
4     unsigned long tally = 0;  
5     int shift=0; // init  
6 LOOP:  
7     // body  
8     tally += 0b1 & number>>shift;  
9     shift++; // update  
10    if (shift<8*sizeof(unsigned long)) { ←  
        // test  
11        goto LOOP;  
12    }  
13    return tally;  
14 }
```

All C loop statements so far translate to assembly at right.

```
count_bits_for:  
count_bits_while:  
count_bits_do_while:  
count_bits_goto:  
    xorl %ecx, %ecx # int shift=0; // init  
    xorl %eax, %eax # unsigned long tally = 0;  
.LOOP:  
    movq %rdi, %rdx # number  
    shrq %cl, %rdx  # number>>shift  
    incl %ecx       # shift++; // update  
    andl $1, %edx.  # 0b1 & number>>shift  
    addq %rdx, %rax # tally += 0b1 & number>>shift  
    cmpl $64, %ecx  # shift<8*sizeof(unsigned long)  
    jne .LOOP       # goto LOOP;  
    ret             # return tally;
```
